

Standard Cell Libraries

GF 55nm

Overview

Silvaco's Standard Cell libraries deliver thousands of highly optimized cells with each one being optimized for power, area, speed, routing, and yield. These libraries may be extended with Power Management Kits, taking power reduction to the next level, and ECO Kits to enable late-stage design modifications.

In addition to a rich set of base standard cells each Silvaco standard cell library offers thousands of cell variants, enabling applications such as low power, minimal area, or high speed. Each cell family in a library is carefully sized, optimizing transistor sizes, P/N ratios, and drive strength granularity for improved power consumption and performance gains.

Multi-bit and multi-height standard cells boost routing density even further by reducing pin count and packing more functionality inside standard cells.

Deliverables

- Verilog gate-level
- Liberty Files (timing and power)
- Place and Route
- ATPG
- GDSII
- Layer Map
- LVS Netlist
- Datasheet

Performance, area, and power specifications are available upon request.
